Energoskopio connects to every device that can connect to the network or any communication channel your infrastructure has

SunnyBrain reads all critical inverter data in real time and automatically sends it to the Cloud, providing continuous oversight of production and consumption through online dashboards and the Energoskopio App.

SunnyBrain connects directly to many different inverters via RS485/Modbus, ensuring reliable data collection and live transmission to the Cloud and to the Energoskopio platform for detailed visualization.

With SunnyBrain, all infrastructure that can be measured and recorded becomes fully “transparent”: production, consumption, MV, weather, voltages and alarms are continuously logged and displayed in Energoskopio for complete control of your infrastructure.
